1 A user enters their information into an intake form.

2 The **Initializer** generates how the event would start for the user.

3 The **Predictor** predicts how the event would affect the specific person's life.

4 The **Writer** writes a specific narrative given the effects and an onset.

5 A user writes about a day in their life as if they experienced the event, while an **Auto-Completer** sends auto-completes based on the current doc and the narrative of the event's effects.
